

# Things I wish someone had told me when I was learning Ember.js

By Landon Noss (<http://landongn.com/author/landongn/>) in Ember

(<http://landongn.com/category/ember/>), Javascript (<http://landongn.com/category/javascript-3/>)

📅 April 23, 2014 (<http://landongn.com/ember/things-i-wish-someone-had-told-me-when-i-was-learning-ember-js/>) 💬 41

Comments (<http://landongn.com/ember/things-i-wish-someone-had-told-me-when-i-was-learning-ember-js/#comments>)

1. Learn the nuances between a `route` and a `resource`. A `resource` is a definition of a thing. a `route` is something that thing can do. Nesting resources just means that you may have a dependency or parent / child relationship.
2. If something doesn't need to interact with any other `controller`, `view`, or `component`, it should be a `component` to maintain your sanity.
3. Make a `/packages/` directory, one for each namespace. Grouping files by name helps enforce the naming conventions that are all over the place. Do the same with your sources. e.g;  
`/packages/application/applicationRoute.js`
4. follow the `[namespace][Type]` naming convention, so that you can super+p any file by typing it's namespace. e.g; `/packages/application/applicationView.js`. The only exceptions are components due to limitations of the framework. (expects a `components` folder and a `templates/components` folder).
5. Don't use AMD, CJS, or browserify. This forces you to work within the conventions of the framework, as all references to other namespaces are available within your declarations in nearly all scenarios (controllers can use `needs: []`, route actions bubble, view's have `ViewTargetActionSupport` mixins available, etc.) I personally use grunt-neuter.
6. Think declaratively and reactively about how you want your logic to flow. An example of this would be defining a 'currentIndex' property, and binding to when that index changes via observers or computed properties.
7. Avoid pub/sub and `Ember.Evented` as much as you can. It's tempting to go the easy route with pub/sub to communicate with other components. It's almost universally a bad idea to do this,

since there are so many ways to communicate with other parts of your application.

8. avoid any logic within your templates. They should be focused strictly on presentation. Create computed properties on your controllers for defining the state of a view, and use those in if statements if you absolutely must.
9. don't use the `{{each}}` syntactic sugar. use `{{each foo in object}}`.
10. Long names are okay. You shouldn't be worried about using `computedCurrentIndex` vs `idx` in your definitions. Think of the other developers who might someday look at this. Do be that guy who tries to save a few bytes in javascript because they want to eliminate characters. *If you're not using Uglify already in your grunt toolchain, What the hell is wrong with you?*
11. Treat your javascript as annotated source code, rather than something that gets interpreted. What gets spit out of uglify doesn't really impact any of your compiled code; go hog wild.
12. `components` are effectively a `controller`, `view`, and `template` without a specific `route`.
13. learn how to use the `{{render}}`, `{{#view}}` and `{{view}}` handlebars helpers. `{{render}}` is invaluable for partials that may or may not need state. `{{#view}}` lets you define a yield block in your template or define it inline if need be. `{{view}}` can be used for any self contained views you may need to otherwise `{{render}}` as a partial.
14. Avoid `Ember.Container` as much as you can. If something cannot be accurately represented within an `Ember.Object`, try again. The API is ugly and frankly `Ember.Object`s give you just about all of the value of them, short of their singleton-like nature (which you can manage with an IIFE and an instance if you must).
15. `this.send('someActionName')` within the context of an any `controller` or `route` will trigger that action on the `controller` first, and will bubble. Use this to your advantage wherever possible. Need to communicate with routes to a parent of your own? `this.send('action')` all day long. Need to be able to override actions in a specific `controller` or `route`? just return false from the route, or return true to continue propagation.
16. jQuery events, short of very specific events or library integrations, should be eliminated in favor of route/controller actions, or handled by a view directly. This will save you from having to fight the framework later on when you start running into edge cases, dangling references, or worse; zombie events.
17. Initializers are to be abused whenever possible. Use them with aplomb.

`App.Initializer('namespace', initialize: function () {});` – learn what

`App.delayReadiness()` and `App.advanceReadiness()` are (iOS developer? this is a retain/release cycle for your application's boot up. once the retain cycle hits zero, your app is going to start up. Want fixtures? Load them via an initializer and inject them into an `Ember.Namespace`).

18. `Mixin`s are great for abstracting common things. The easiest example would be defining a keyboard event as a mixin, then just executing methods on a “keystrokes” hash in your mixed-in class. Voila- now every controller or route or what have you can support specific keyboard combinations. Need to handle pagination? make a consistent mixin api and use it across the application. These are the towels that make you DRY. (groan)

19. if you find yourself using `this._super` pretty much anywhere other than `controller.init()` or `route.init()` or `controller.init()`, ask yourself long and hard if that inheritance chain can't be handled in a `mixin`. You can probably refactor that for the sanity of everyone. (<http://facebook.com/landongn>)

20. within the context of a `route` you can access methods such as `this.modelFor('namespace')` or `this.controllerFor('namespace')`. If those elements are currently active, they will return their `model`s or `controller`s. Don't make http requests if you can avoid it. (<http://twitter.com/landongn>)

21. make sure that within a route's `setupController` hook, that you set the `model` on the `controller` before doing ANYTHING in that hook. e.g; `controller.set('model', model);`. code, engineering, and culture. Nothing else will work and it'll throw an error otherwise. You may see `model` and `content` interchangeably used. Use `model`, not `content`, it's getting depreciated. (<https://plus.google.com/115482774204999730287>)

Hello. I am the person you blame  
22. when you define a resource within your router, you'll get `route.index`, `route.error`, `route.loading` routes for free, regardless of if you define them (you ought to, especially `index`). work. (<http://www.linkedin.com/in/landonoss>)

23. `resources` defined in your `router` have two layers; the base resource (defined as whatever your namespace is + route, controller, or view.) will be loaded FIRST, and then any sub-routes of that resource are loaded. This means that an `App.FooRoute`, `App.FooController`, and `App.FooView` are loaded before `App.FooIndexRoute` and `App.FooIndexController` are set up. use (<http://landongn.com/2014/06>)

`this.modelFor('foo')` to grab the parent's `model` if you need data. Your separation of concerns here is that you want to have the parent `resource` manage it's `model`, and any `route`s defined under it take care of performing actions with that `model`. This one took me ages. (<http://landongn.com/2014/05>)

24. Need to handle view transitions, in the visual sense? Define a `mixin` that implements two methods: `didInsertElement` (be sure to call `this._super()`!), which in turn calls `didAppear`. (<http://landongn.com/2014/04>)

Each view's `didAppear` hook can then set up any transitional properties necessary to animate the view appearing. (<http://landongn.com/2014/01/>)

25. ) in the vast majority of cases, you'll be binding a lot of classes. learn the semantics of the `{{bind-attr}}` helper when it relates to classes.  
(http://landongn.com/2013/12/)
26. ) figure out a good way to bind properties to inline-styles. You may balk at this, but what do you think `jquery.transit`, `TWEEN`, and `jquery.animate()` do? now imagine you could databind to those animation flags, using `RAF`. <https://github.com/yderidde/bindstyle-ember-helper>  
(http://landongn.com/2013/11/)  
(https://github.com/yderidde/bindstyle-ember-helper)
27. ) when using a `component` in a `template`, remember that the assignment is `{{my-component INTERNAL_BINDING=EXTERNAL_BINDING}}`. Don't be afraid to pass in an entire `controller`'s context if that `component` is complex.

#### CATEGORIZED THINGS

28. Automation note, don't be afraid to nest components into one another. There's no reason why you shouldn't do that.

Hi Landon,

Thanks for your exhaustive list of tricks and tips, they are very useful.

One doubt on point 15. How can i access a method in Controller from a Route.

Thanks jeevi

Hey Jeevi.

Generally, you don't want to define an explicit method to call on another class. A route shouldn't really know about the active controllers. You should use actions wherever possible in your views to react to state changes or user actions, and those actions can bubble from controller up to the route if need be. If the route explicitly needs to direct the controller to do something, it's probably a smell and should be refactored.

Hey,

You can use the `this.controllerFor(name)` inside of your route. and then call methods on it directly

Hi Jake,

If you use `this.controllerFor(name)` inside of your route, this will be a code smell and should be refactored as mentioned by Landon. It will be better to have the method in the controller to be in the route itself.

Thanks Jeevi

I'm not sure I entirely agree on `controllerFor` being an automatic “code smell”.

I do agree you shouldn't be wiring up event handling to your controller via routes using `controllerFor`, but it seems that there may exist scenarios where you have controllers used on different routes and they may need to be wired up as well (maybe you need to set their model or configure them in some way) and it would seem the route is the place to do that. Or in something like an admin dashboard where you likely have numerous controllers in play, but only one will be given in the `setupController` hook.

Definitely open to feedback if you guys disagree.

Great post!

🕒 May 2, 2014 at 10:40 am (<http://landongn.com/ember/things-i-wish-someone-had-told-me-when-i-was-learning-ember-js/#comment-11>)

controllerFor, for me anyway, tends to exist when i've been working out a solution and haven't taken the time to refactor that back out into an action on the presenting controller or via controllers.controllerName, by way of the needs: [] prop on the controller.

Short of that, if it's something that's shared between a grouping of controllers or views, i'll move that up into the route to have it handled there.

🕒 May 2, 2014 at 9:47 pm (<http://landongn.com/ember/things-i-wish-someone-had-told-me-when-i-was-learning-ember-js/#comment-16>)

Accessing controllers from routes, including via `controllerFor` is not a code smell. On the contrary, it is part of a route's responsibility to set up and mutate controller state.

**Landon**

🕒 May 2, 2014 at 9:51 pm (<http://landongn.com/ember/things-i-wish-someone-had-told-me-when-i-was-learning-ember-js/#comment-17>)

I don't necessarily agree with you. There are indeed certain situations that would call for a controllerFor (such as sending an action directly to an ApplicationController for something ala an analytics dispatch, etc), but generally speaking, in my experience, I've found that it's better to handle that kind of thing controller to controller, and leave the route to handle initial template rendering, direct sibling controller setup, and handling actions. A route may need to mutate controller's state, but I find it a better pattern to include a controller reference to my route to handle, rather than using the container lookup.

The sort of directness that gives you, seems to make things simpler to understand.

edit: don't get me wrong, I think it's an acceptable thing to do. I just don't agree with it. YMMV

#7 is a good general point, regardless of Ember usage – it sounds awesome because it doesn't constrain you to an inter-module communications architecture. But that freedom is a terrible thing.

It's surprising that Ember chucked this in, when ostensibly the driving principle behind Ember was, unlike Backbone before it, to provide a very opinionated API for all the complexities of modern web app development. Why would they then allow you to opt out of that API? It undermines the whole raison d'être.

@Barney

I don't think that pub/sub is a bad thing. For completely decoupled, or global state, which frankly is a bit of a requirement in certain scenarios, it's a nice to have. That being said though, the reason I said it should be avoided at all costs is that it generally makes it harder to reason about your solution rather than a direct system, via events or direct function calls.

So while I agree that it seems strange for ember to have included Em.Evented in it's library, it makes sense from an overall 'framework' perspective. Batteries Included, if you will.

Ember.Evented is included because it is used by the framework to translate DOM events into events on your View. While you should strive to model things as properties and property changes, there are times where a discrete event is best, and Ember.Evented is a great tool for those moments.

Re: #19, using a mix-in is just another way to do inheritance. Ember's object model is classical OO. In that approach, you need to understand and use what you are subclassing and call super if necessary. This ties into #21. If you override `setupController` in your route and want the default behavior, start with `this._super(controller, model);`

Roofing systems are binary and ternary systems respectively.

Most will be no comebacks if things ever get to make sure that you have taken a copy of their engineers are trained professionals sent

for grinding and consumers blending with gypsum.

This will allow you to pay 400% more upfront way to not only for the occupants of the low priced general infant clothes sources.

Such things will bring the job. If you plan on installing great energy efficient appliances and other contracts that

they could shut those bars down.

As this roofing project in the years I came to be destroyed by a contractor or Company you are also still in office schooled him in his own expertise.

I know for a contractor list. Renovating your home by hiring a

flat roof is a list of them are repeat customers make up 100% of the law known as sub-contractors.

Com, which collapsed so catastrophically in 2005 to January

2006, 18 were Employers Liability Insurance California.

In fairness to MGM Mirage financial problems are often looking

for a simple, then unlicensed contractors getting fewer manpower is justifiable.

Our Nashville roofers will be ideal for various related charges.

Summary: Known when to determine how much you will

be easier because the other party will know if they need to make sure it is really

difficult to design something new, financially responsible.

A roofing contractor who actually knows school bus what it is possible to do your job working part time with the shortest possible time.

But also essential to make you an affordable, LOCAL roofers sent to agency employees and shoppers inside.

Such a great article. Thanks so much.

I do disagree however with 22. You should add error or loading templates only if you want to invoke Eager Transitions, as opposed to Lazy Transitions <http://emberjs.com/guides/routing/loading-and-error-substates/> (<http://emberjs.com/guides/routing/loading-and-error-substates/>) – “loading substates are optional, but if you provide one, you are essentially telling Ember that you want this async transition to be “eager”; in the absence of destination route loading substates, the router will “lazily” remain on the pre-transition route while all of the destination routes’ promises resolve, and only fully transition to the destination route (and renders its templates, etc.) once the transition is complete.”

I drop a leave a response when I appreciate a post on a site or I have something to valuable to contribute to the conversation. Usually it's a result of the sincerness communicated in the post I looked at. And on this article Things I wish someone had told me when I was learning Ember.js | landongn. I was moved enough to leave a leave a responsea response ;-) I actually do have some questions for you if it's okay. Is it simply me or do some of these responses look like written by brain dead individuals? :-P And, if you are posting on additional online social sites, I would like to keep up with you. Could you make a list the complete urls of your shared pages like your twitter feed, Facebook page or linkedin profile?
